

WE ARE HIRING!

The conservation coalition blends tech with on-ground ecological insights, uniting communities, scientists, and forest departments to restore forests at scale.

Send us your profile, a quick note on why this excites you, and anything that you've built, broken, or believed in :)

hello@tech4goodcommunity.com

WHAT IT ENTAILS

- Your code will be used by people restoring degraded landscapes, tracking invasive species and protecting biodiversity.
- You'll be expected to think deeply, work independently, and care about outcomes more than outputs.
- Ability to ship usable software to the field, then improve it based on real feedback.
- Problem solving, writing code, product and UX mindset.

MUST HAVE

- JS, python, flutter, mongoDB. Full stack flexibility is gold.
- Data security and privacy (a big deal when it comes to protected areas)
- Skills to prototype fast, talk to users, build both UX and infra that actually works in the wild
- Tie together forest ecology, AI models and simple mobile workflows

GOOD TO HAVE

- You don't always expect a clean roadmap, and a product manager to tell you what to do.
- Experience with AI/ML frameworks
- Your own tools, if they're better
